

XI HAN

39 Montclair Dr, Selden, New York 11784, United States
(+1) 631-710-8313 | xihan1@cs.stonybrook.edu | <https://axihixa.github.io/>

EDUCATION

- Ph.D. in Computer Science | Stony Brook University | In Progress.** Aug 2019 – Present
Dept. of Computer Science, Stony Brook University, New York, United States | GPA: 3.9/4.0
Expected to graduate between Dec 2025 and May 2026 (flexible).
- B.E. in Computer Science and Technology | Tsinghua University** Aug 2015 – Jul 2019
Dept. of Computer Science and Technology, Tsinghua University, Beijing, China | GPA: 3.25/4.0

SKILLS

- **TL;DR.** C/C++/CUDA/Python; GPU Algorithms; Mamba; PDEs; Computer Graphics; Machine Learning.
- Expert in GPU algorithms for AI/HPC: Customized AI operators, AI model training/inference efficiency optimization. Involved techniques: PyTorch C++/CUDA extensions, GPU kernel profiling, fine-tuning, operator fusing, cache optimization, etc.
- Expert in Computer Graphics and Numerical Analysis: Neural PDE solvers, customized CUDA operators.
- Expert in languages: C/C++ (OOP, STL, Metaprogramming and Concurrency), CMake, CUDA (including PTX) and Python.
- Expert in tools: PyTorch Profiler, CUDA-GDB, Nsight Compute and NVIDIA Compute Sanitizer.
- Expert in frameworks: PyTorch and OpenGL.
- Familiar with: Linux systems and the Qt framework.
- Knows: Bash, Assembly, MATLAB, Java, Objective C/C++ and Swift.

WORK EXPERIENCE

- Research Assistant & Teaching Assistant** Aug 2019 – Present
Stony Brook University, New York, United States
- Conducted research projects on GPU algorithms, neural PDE solvers, PDE-driven foundation models (e.g., Mamba), and Computer Graphics. Research work is published in top-venue conferences, including ICML and CVPR.
 - Extensive project experience on AI training/inference efficiency optimization. Involved techniques: CUDA kernel fusing, performance profiling, and PyTorch CUDA extensions.
 - Hosted lectures on OpenGL programming with C++/Python, the implementation details of computer graphics applications and algorithms, and the state-of-the-art research topics on graphics and physics-based modeling.
- Research Assistant** Jan 2017 – Jul 2019
Tsinghua University, Beijing, China
- Deployed a MobileNet module on IOS platform with Apple’s CoreML framework, and delivered an IOS app for a human segmentation (in Swift and Objective C++).
 - Optimized the model used in the app (increased accuracy and added key point recognition) and achieved 10x speedup in FPS.

SELECTED PROJECTS

- 2DMamba: A Hardware-Aware 2D Selective State-Space Model with Applications in Image Processing**
- **TL;DR.** 2DMamba employs a geometric-rigorous and hardware-aware 2D SSM formulation, which extends 1D Mamba into 2D while maintaining its modeling capabilities, high parallelism, and memory efficiency.
 - Implements a warp-scan based 2D parallel scan routine which supports scanning prefix callbacks for global tiling. Extends 1D

Mamba scanning operation into 2D while maintaining its training/inference efficiency. Compared to a naïve implementation, achieves a throughput of 10x, while the GPU memory consumption is only 10%.

- Involved techniques: Warp shuffle and parallel scans, 2D tiling and caching, HBM access optimization, CUDA kernel and AI model profiling, and PyTorch CUDA extension encapsulation.
- Code available at <https://github.com/AtlasAnalyticsLab/2DMamba>.

UGrid: An Efficient-And-Rigorous Neural Multigrid Solver for Linear PDEs

- **TL;DR.** UGrid is a neural solver for Partial Differential Equations (PDEs) with convergence guarantee.
- Built upon the combination of the U-Net architecture and the legacy MultiGrid PDE solver, provides users with high speed (up to 20x speedup against legacy solvers), high precision (relative residual as low as $1e-5$), high robustness (against irregular and noisy input), high generalization power (to irregular boundary geometries and topology), and high scalability (without need for retraining).
- Involved techniques: Numerical analysis on convergence, customized AI operators (Python and CUDA based). Implements a customized CUDA convolution module to save computation for specific-shaped convolution kernels used in PDE solvers.
- Code available at <https://github.com/AXIHIXA/UGrid>.

CUDA Baseline Experiments: Performance Profiling and Optimization

- **TL;DR.** Implements and fine-tunes multiple CUDA baseline algorithms.
- Implemented baselines and their optimizations:
 - ☐ Parallel reduction (with loop unrolling and warp shuffle primitives).
 - ☐ Histogram and Copy-If (with atomic primitives).
 - ☐ Parallel scan (WarpScan and Raking variants).
 - ☐ Fused Biased-Mask-Scale-Add (fp32 and fp16, for fp16, with half precision primitives like `__hadd2`).
 - ☐ SGEMM and GEMV (loop unrolling, SMEM padding, warp tiling and double buffer optimizations, reaching 90% throughput of cuBLAS).
 - ☐ Dropout (with cuRAND APIs).
 - ☐ Fused SoftMax/LayerNorm/RMSNorm, Im2Col, Matrix transpose, etc.
- Code available at <https://github.com/AXIHIXA/CudaDemo>.

Misc

- Language Proficiencies:
 - ☐ Chinese (Mandarin): Native speaker.
 - ☐ English: Fluent, near-native proficiency. TOEFL: 106/120; GRE: 324/340 + Writing 3.5.
 - ☐ Japanese: Sufficient for basic working scenarios. JLPT: N1 173/180, N2 169/180.
